General

Subject Area(s):

- Human Computer Interface
- Information Management
- Machine Learning
- Mobile Application Development

Abstract:
OrderVista is a centralized platform that empowers consumers to track, organize, and manage all their upcoming online orders from various retailers and couriers in one unified dashboard. By leveraging machine learning for image/text extraction and large language models for intelligent parsing and assistance, OrderVista simplifies the process of monitoring deliveries, handling returns, and staying informed about incoming packages. Users can import order data via email, screenshots, or photos of receipts/labels, making the platform highly accessible and retailer-agnostic.

Outcome

Objectives:

- To develop a seamless web/mobile app for consumers to consolidate and visualize all upcoming orders and deliveries.
- To integrate image recognition (OCR, barcode/label reading) and LLM-driven parsing for easy order entry from any source.
- To provide smart assistance for delivery timelines, return management, and proactive notifications.
- To enhance user experience through natural language queries and interactive dashboards.

Deliverables:

- A responsive mobile application (OrderVista) with user authentication and dashboard.
- Modules for importing orders via email, image upload, and screenshot parsing.
- Integrated OCR and LLM pipeline for extracting and organizing order details.
- Timeline/calendar visualization and notification system for deliveries.
- Return management assistant and FAQ/chatbot for user queries.
- Documentation and user guide.

Environment

Hardware(s):

- Mobile Device: Android
- Mobile Device: Apple iPhone
- Notebook: Apple MacBook Air

Software(s):

- Browser: Google Chrome [Free]
- SDK: Android
- SDK: Apple iOS

Relationship

Related Past Project(s):
(nil)
Liaison with Industry:

- Potential collaboration with e-commerce platforms, courier services, or third-party logistics companies for feature validation and feedback.
- Consultation with industry experts in consumer logistics and UX design.

End Users:

- General consumers who shop online and receive multiple packages from various retailers.
- Power users (e.g., gadget enthusiasts, small business owners) who handle large order volumes.

Remark

Remark:
OrderVista addresses a growing need among consumers overwhelmed by fragmented package tracking. By fusing modern mobile development with practical AI, the project offers both technical challenge and real-world impact. The platform is designed to be extensible for future features, such as smart home integrations or deeper retailer partnerships.
